

Ex.No. 2: Implementing TDMA Slot Allocation in GSM.

1. To calculate the Time Slot Duration in a GSM TDMA frame by dividing the total frame time into equal time slots. This helps in understanding the time structure of GSM communication.

2. To determine the Frame Utilization (%) based on the number of allocated time slots compared to total available slots. This evaluates the efficiency of TDMA resource usage.

3. To compute the Number of Allocated Time Slots for multiple users in the GSM system.

This ensures proper scheduling and interference-free communication.
